

# IncuWeather

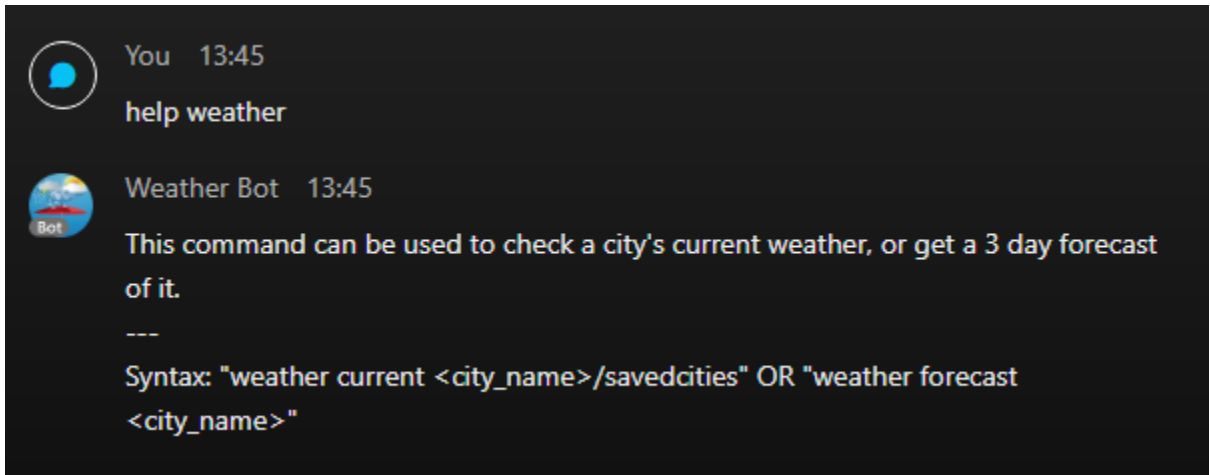

By Francisco Gonçalves

This bot was done for the 4<sup>th</sup> homework of the Automation track. My solution is a bot that tells you information about the time and weather of various cities. This was achieved by using a free API called "WeatherAPI". The bot allows you to use various commands:

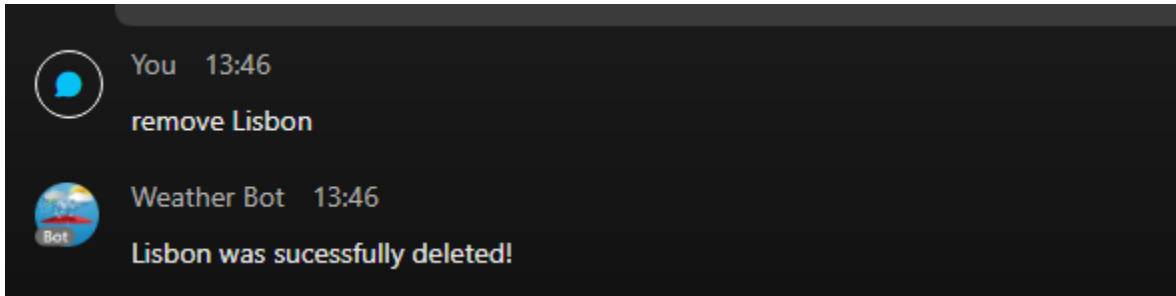

- help - Provides general information on how to use this bot

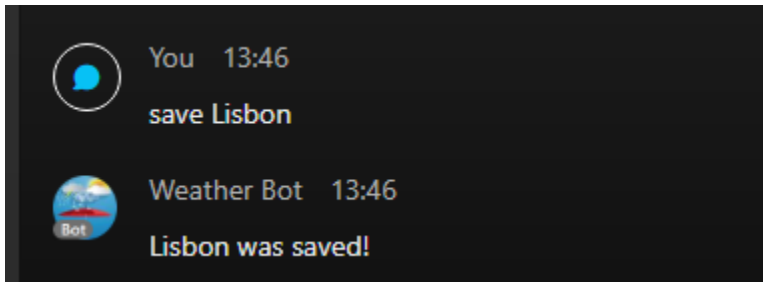

- help <Command> - gives you more information about the usage of said command

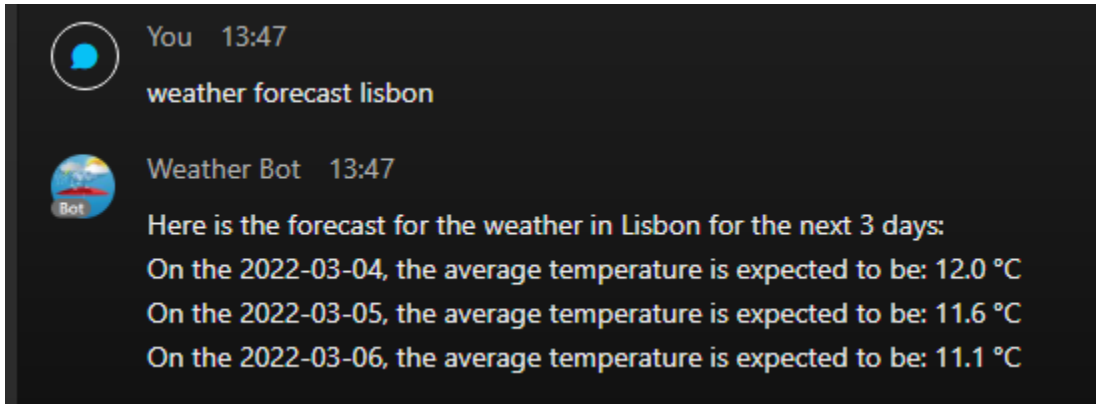

- remove <cityname> - removes city from the mysql database

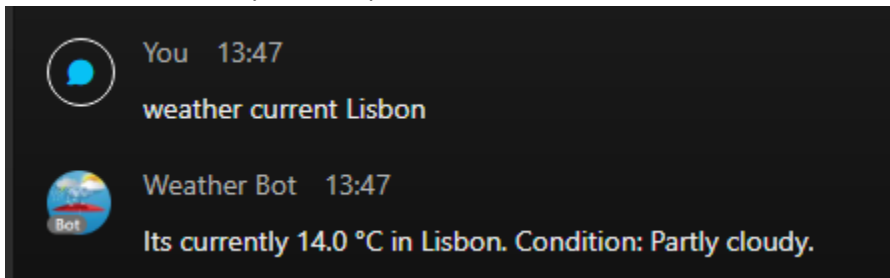

- save <cityname> - adds the city to the mysql database

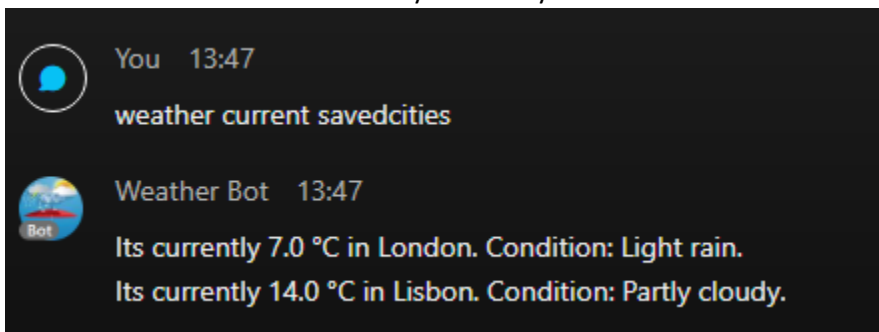

- weather forecast <cityname> - provides a 3 day forecast of the weather in the chosen city

- weather current <cityname> - provides the current weather situation in the chosen city

- weather current savedcities – if the user saves cities to the database, this command provides the current weather situation for every saved city

- `time <cityname>` - provides the current time in the chosen city
